Swamp milkweed is an erect, herbaceous perennial wildflower. Its showy pink flowers are slightly fragrant. They are born in compact terminal or axillary umbels. Individual flowers have reflexed corollas and an upright corona — a characteristic typical of milkweed flowers. Leaves are long (up to 6 inches), elliptic to lanceolate, and glabrous. They are oppositely arranged. Stems are stout, glabrous and multi-branched. Seeds are flat and brown with silky white hairs attached. They are born in pods, which split open when ripe. Seeds are dispersed when their silky hairs catch the wind.

Swamp milkweed occurs naturally in floodplain swamps, hydric hammocks, wet pine flatwoods and marshes. It typically blooms in summer and attracts many pollinators. It is a larval host plant for monarch, queen and soldier butterfly caterpillars.

The genus *Asclepias* is named for Asclepius, the Greek god of healing.

**Family**: Apocynaceae (Dogbane family)

**Native range**: Most peninsular counties, Wakulla County

To see where natural populations of Swamp milkweed have been vouched, visit www.florida.plantatlas.usf.edu.

**Hardiness**: Zones 8b–10b

**Soil**: Wet to moderately dry soils

**Exposure**: Full sun to minimal shade

**Growth habit**: 2–3’+ tall, 1–2’ wide

**Propagation**: Seed

**Garden tips**: Swamp milkweed is one of the most striking native milkweeds. It makes an excellent addition to moist, sunny landscapes, but can tolerate occasional drought once established.

**Caution**: All milkweeds contain a toxic latex sap that may irritate skin.

Swamp milkweed are often available from nurseries that specialize in Florida native plants. Visit www.PlantRealFlorida.org to find a nursery in your area.
